

Keep focus!

A new approach for start-ups

Start-ups are often struggling to get hold of all medical device regulations (MDR) that are needed to develop their technology. Setting up processes to meet the MDR is an expensive and time consuming activity for start-ups which also distracts them from their focus on developing and marketing their technology. Baat Medical can handle these processes which will save start-ups time and money.

When start-ups partner with Baat Medical, they can keep their fixed expenditure low and can make use of the efficient Baat processes. This provides start-ups with ultimate flexibility.

Start-ups can focus on their technology development while we take care of engineering, the regulatory and quality system, enterprise resource planning system, ISO 13485, product responsibility, warehousing, verification and validation, post market surveillance, post market clinical follow-up and correspondence with the notified body.

Launching new products together: assisting you throughout the process

About BAAT

Baat Medical was founded in 1999 by Gert Nijenbanning after finishing his PhD thesis on scoliosis correction. In the first period BAAT provided general engineering services for the medical devices market. Soon after the start, Arthur Aalsma joined the company and from that time on we specialized in orthopedic product development.

The company has now grown to 30 employees and offers a complete service package, from Market Mapping & Concept generation, to development and supply chain management. BAAT has set up a state-of-the-art quality management system, warehouse, testing facilities and full engineering & design procedures are in place.

Our customers range from Multi-National Orthopedic giants to start-up companies and everything in between.
